

Figure S3: Lollipop plots showing the peak date of occurrence of the marine heatwaves (MHWs) clustered into each node. The height of the lolli shows duration (days), and the colour shows the maximum intensity (°C) of the event. Note how different nodes have a tendency towards longer more intense, shorter less intense events, or how some nodes have a tendency towards containing events that occurred in the second half of the time series. The dashed line shows the mean duration per node, and the dotted line shows the median.
